## **Overdose Response Training**

***Anyone at risk for overdosing on heroin or prescription pain medication and anyone who may have an opportunity to help someone experiencing an overdose are invited to attend this 2 hour training.***

### **You will learn:**

- ❖ Types of Opioids
- ❖ How to Recognize, Respond, and Prevent an Opioid Overdose
- ❖ How to administer naloxone
- ❖ Resources for Family Members, Friends & Loved Ones

### **What is naloxone?**

It is a prescription medicine that reverses an opioid overdose. It cannot be used to get high and is not addictive. Naloxone is safe and effective; emergency medical professionals and doctors have used it for decades.

### **How does naloxone help?**

Naloxone is an antidote to opioid drugs. Opioids can slow or stop a person's breathing, which causes death. Naloxone helps the person wake up and keeps them breathing.

An overdose death may happen hours after taking drugs. If a bystander acts when they first notice a person's breathing has slowed, or when they can't awaken a user, there is time to call 911, start rescue breathing (if needed) and give naloxone.
